

BRICS Mini-course
on
Quantum Computation

A. Berthiaume
C.W. I.

Session I: Introduction

Interferometer:

 : Mirror

 : Half-Silvered Mirror

Historical Remarks:

- 1982 Benioff/Feynman
idea of a fully QM comp.
- 1985 Deutsch
Formalism for QTM
- 1989 Deutsch
Formalism for Q circuits
- 1993 Yao
 $QTM \equiv Q \text{ circuits}$
- 1995 BBC et al.
Quantum gate results

Quantum Basics:

Basis States: all classically distinct alternative of a given property.

ex. of properties:

- position
- path
- orientation

Notation: if x is the label of an alternative, then that state is noted

$|x\rangle$

N.B.: $\frac{1}{2}|4\rangle \neq |2\rangle$

NO!

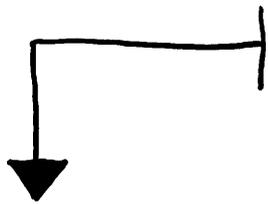

Quantum Basics (cont.):

amplitude: The probability of an alternative X is given by the square norm of a complex number α .

$$P(|X\rangle) = |\alpha|^2$$

State Vector: A sum of all alternatives weighted by their amplitudes.

Normalized!

$$\sum_{i \in B} |\alpha_i|^2 = 1$$

$$|\psi\rangle = \sum_{i \in B} \alpha_i |i\rangle$$

where

$$B = \{i \mid i \text{ is a label}\}$$

is a set of basis states

Quantum Basics (cont.):

All possible $\sum_{i \in B} \alpha_i |i\rangle$ form
 a complex vector space (a
 Hilbert space).

$$|\psi\rangle = \sum_{i \in B} \alpha_i |i\rangle \quad \rightarrow \quad \begin{pmatrix} \alpha_1 \\ \alpha_2 \\ \vdots \end{pmatrix} \in \mathbb{C}^{\#B}$$

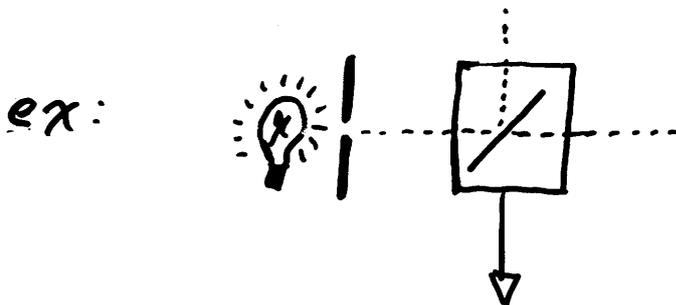

$$\text{Dim}(|\psi\rangle) = \#B$$

Quantum Basics (cont.):

Evolution: state vectors are transformed through unitary matrices.

$$UU^T = I$$

$$U|\psi\rangle = |\psi'\rangle$$

$$U|H\rangle = \alpha|H\rangle + \beta|V\rangle$$

$$\text{where } |\alpha|^2 = |\beta|^2 = 1/2$$

Quantum Basics (cont.):

Observable: an observable O is a partition of \mathcal{H} in E_1, \dots, E_k subspaces such that

$$\mathcal{H} = E_1 \times E_2 \times \dots \times E_k$$

and $\forall i \neq j \quad E_i \perp E_j$

N.B.: The property determines the partitioning.

Quantum Basics (cont.):

Observation: Let $|\varphi\rangle = \sum_{i \in B} \alpha_i |i\rangle$ in

\mathcal{H} . We want to observe this state with

$$\mathcal{O} = \{E_1, \dots, E_k\}$$

$$|\varphi\rangle = \sum_{i \in B} \alpha_i |i\rangle \Rightarrow |\varphi\rangle = \sum_{j=1}^k \beta_j |\varphi_j\rangle$$

where

$$|\varphi_j\rangle \in E_j$$

Observing will:

- 1) select E_j with prob. $|\beta_j|^2$
- 2) $|\varphi\rangle \rightsquigarrow |\varphi_j\rangle$
- 3) All we learn is "j"

Quantum Basics (cont.):

Notation: if $|\psi\rangle = \sum_i \alpha_i |i\rangle$

then

$$(|\psi\rangle)^\dagger \equiv \langle\psi| = \sum_i \alpha_i^* \langle i|$$

Projection: (inner product)

Let $|\psi\rangle = \sum_i \alpha_i |i\rangle$ and

$|\chi\rangle = \sum_i \beta_i |i\rangle$ then

$$|\psi\rangle \cdot |\chi\rangle = \langle\chi|\psi\rangle$$

$$= \sum_{i,j} \beta_i^* \alpha_j \langle i|j\rangle$$

↓
0 if $i \neq j$
1 o.w.

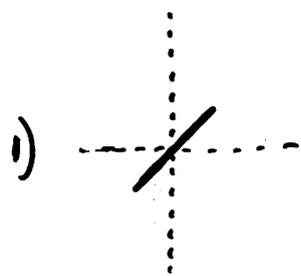

$$= \sum_i \beta_i^* \alpha_i$$

Working out the interferometer:

Basis States: $B = \{ |H\rangle, |V\rangle \}$

Initial State: $|s\rangle = |H\rangle$

Transformations:

$$|H\rangle \rightarrow \frac{1}{\sqrt{2}}(|H\rangle + i|V\rangle)$$

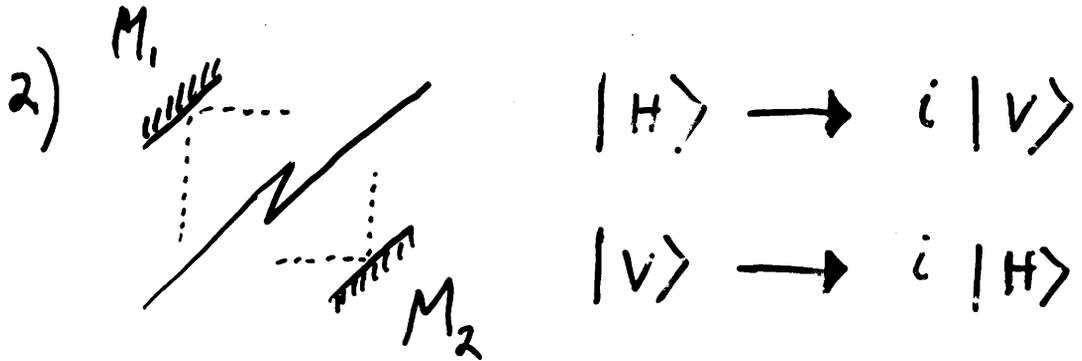

$$|V\rangle \rightarrow \frac{1}{\sqrt{2}}(i|H\rangle + |V\rangle)$$

if $|H\rangle = \begin{pmatrix} 1 \\ 0 \end{pmatrix}$ and $|V\rangle = \begin{pmatrix} 0 \\ 1 \end{pmatrix}$ then

$$M_{\frac{1}{2}} = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & i \\ i & 1 \end{pmatrix}$$

Note: $M_{\frac{1}{2}} M_{\frac{1}{2}}^\dagger = I$

Working out ...

$$|H\rangle \rightarrow i|V\rangle$$

$$|V\rangle \rightarrow i|H\rangle$$

so
$$M = \begin{pmatrix} 0 & i \\ i & 0 \end{pmatrix}$$

Note:
$$MM^T = I$$

Working out ... :

$$|H\rangle \longrightarrow \frac{1}{\sqrt{2}} (|H\rangle + i|V\rangle)$$

$$\longrightarrow \frac{1}{\sqrt{2}} (-|H\rangle + i|V\rangle)$$

$$\longrightarrow \frac{1}{\sqrt{2}} \left[-\frac{1}{\sqrt{2}} (|H\rangle + i|V\rangle) + \frac{1}{\sqrt{2}} (i|H\rangle + |V\rangle) \right]$$

$$= \frac{1}{2} (-|H\rangle - i|V\rangle - |H\rangle + i|V\rangle)$$

$$= \frac{1}{2} |H\rangle$$

$$M_{\frac{1}{2}} M M_{\frac{1}{2}} |H\rangle = M_{\frac{1}{2}} M \underline{M_{\frac{1}{2}}} \begin{pmatrix} 1 \\ 0 \end{pmatrix}$$

$$= M_{\frac{1}{2}} M \begin{pmatrix} 1/\sqrt{2} \\ i/\sqrt{2} \end{pmatrix}$$

$$= M_{\frac{1}{2}} \begin{pmatrix} -1/\sqrt{2} \\ i/\sqrt{2} \end{pmatrix}$$

$$= \begin{pmatrix} -1 \\ 0 \end{pmatrix}$$

Quantum Computation Basics:

Qubit: a quantum state of the form

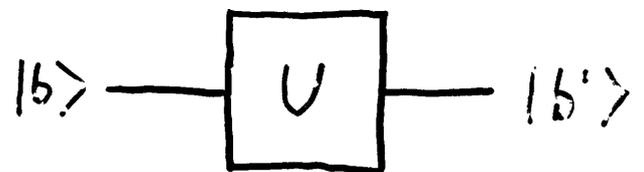

$$|b\rangle = \alpha |0\rangle + \beta |1\rangle$$

$$\text{where } |\alpha|^2 + |\beta|^2 = 1$$

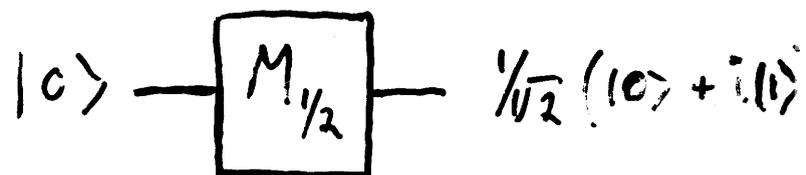

Qugate: (for 1 qubit) is a 2×2 (or gate) unitary matrix U .

$$U|b\rangle = |b'\rangle$$

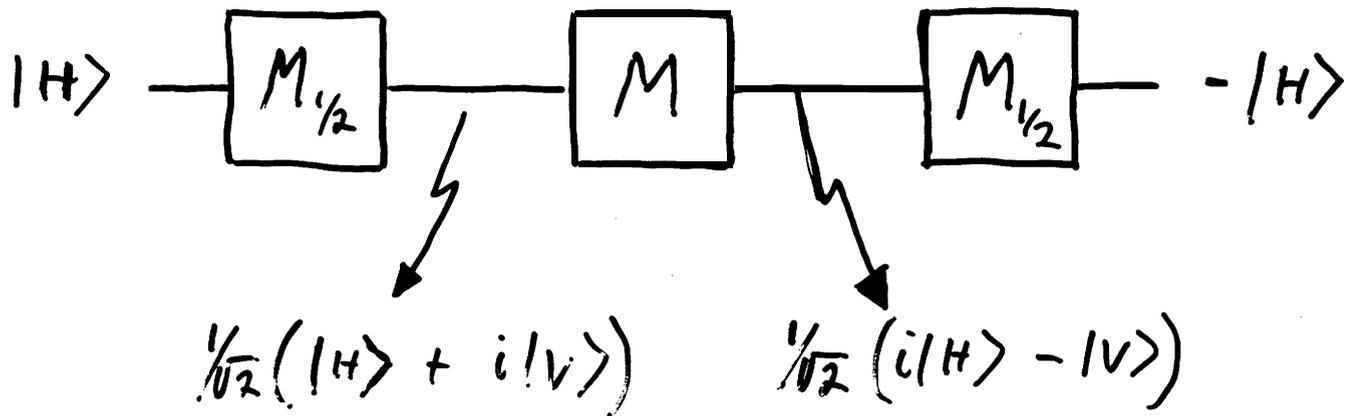

Notation:

ex: $U = M_{1/2}$

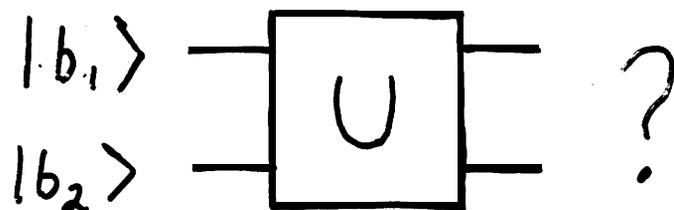

The interferometer in gates:

QC Basics (cont.):

Qugate: (for 2 qubits)

What's the joint basis?

What's the joint state?

Tensor Product: \otimes

When we have 2 qubits:

Joint basis: $\mathcal{B}_2 = \{|00\rangle, |01\rangle, |10\rangle, |11\rangle\}$

Joint state: if $|b_1\rangle = \alpha_0|0\rangle + \alpha_1|1\rangle$
and $|b_2\rangle = \beta_0|0\rangle + \beta_1|1\rangle$
then

$$|b_1\rangle \otimes |b_2\rangle = |b_1\rangle |b_2\rangle = \sum_{i,j=0}^1 \alpha_i \beta_j |ij\rangle$$

Entanglement:

$$\text{Let } |\psi\rangle = \alpha_1 |00\rangle + \alpha_2 |01\rangle + \alpha_3 |10\rangle + \alpha_4 |11\rangle$$

$$\begin{aligned} \text{If } |\psi\rangle &= (\beta_1 |0\rangle + \beta_2 |1\rangle) \otimes (\gamma_1 |0\rangle + \gamma_2 |1\rangle) \\ &= |b_1\rangle \otimes |b_2\rangle \end{aligned}$$

then $|b_1\rangle$ and $|b_2\rangle$ are independent

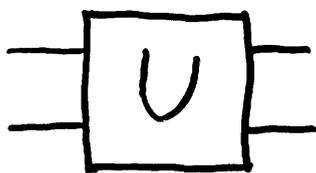

Otherwise $|\psi\rangle$ is entangled

$$\begin{aligned} \text{ex: } |\psi_1\rangle &= \frac{1}{2} [|00\rangle + |01\rangle + |10\rangle + |11\rangle] \\ &= \frac{1}{\sqrt{2}} (|0\rangle + |1\rangle) \otimes \frac{1}{\sqrt{2}} (|0\rangle + |1\rangle) \end{aligned}$$

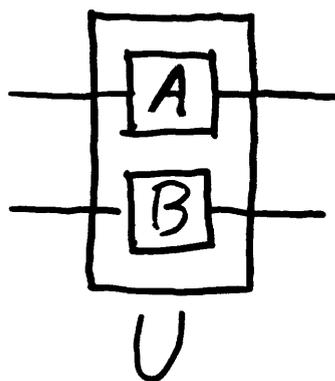

$$|\psi_2\rangle = \frac{1}{\sqrt{2}} (|00\rangle + |11\rangle) \text{ is entangled}$$

Quantum gates on 2 qubits:

In general: a 4×4 unitary matrix

Special Case

then $U = A \otimes B = \begin{pmatrix} a_{11} B & a_{12} B \\ a_{21} B & a_{22} B \end{pmatrix}$

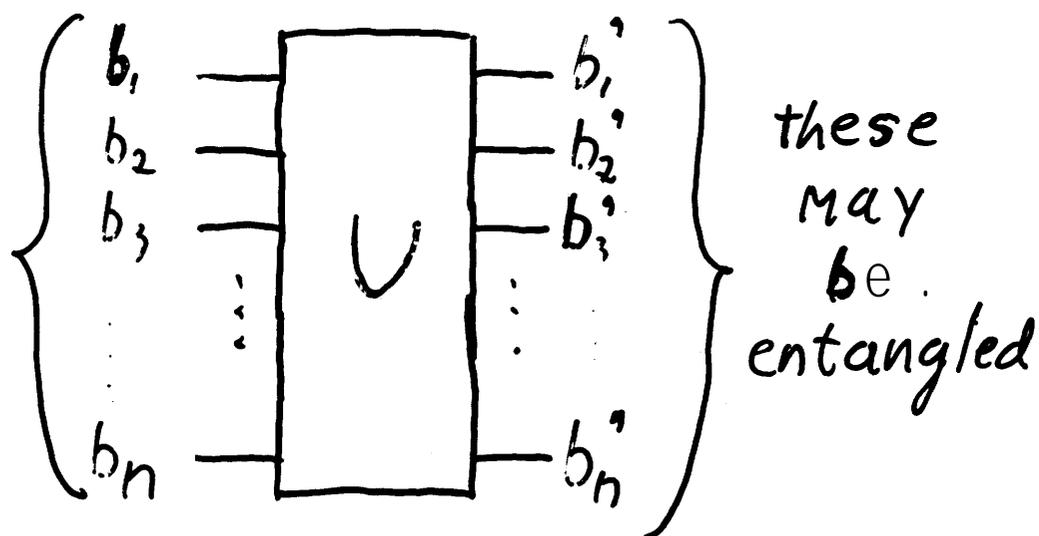

Quantum Register:

Def: an n qubit quantum register is a quantum state of the form

$$|\psi\rangle = \sum_{i=0}^{2^n-1} \alpha_i |i\rangle$$

Where $|i\rangle$ is the i^{th} binary string on n bits

n -qugates: qugates on n qubit registers are $2^n \times 2^n$ unitary matrices.

Modified Deutsch-Jozsa Problem:

Let $f: \{0,1\}^n \rightarrow \{0,1\}$ computable.

We define:

* Non-Balanced: There is a majority of 0's (or 1's)

** Non-Constant: $\exists x, y$ s.t. $f(x) \neq f(y)$

Problem: Given f , output $P \in \{*, **\}$ such that $P(f)$ is true

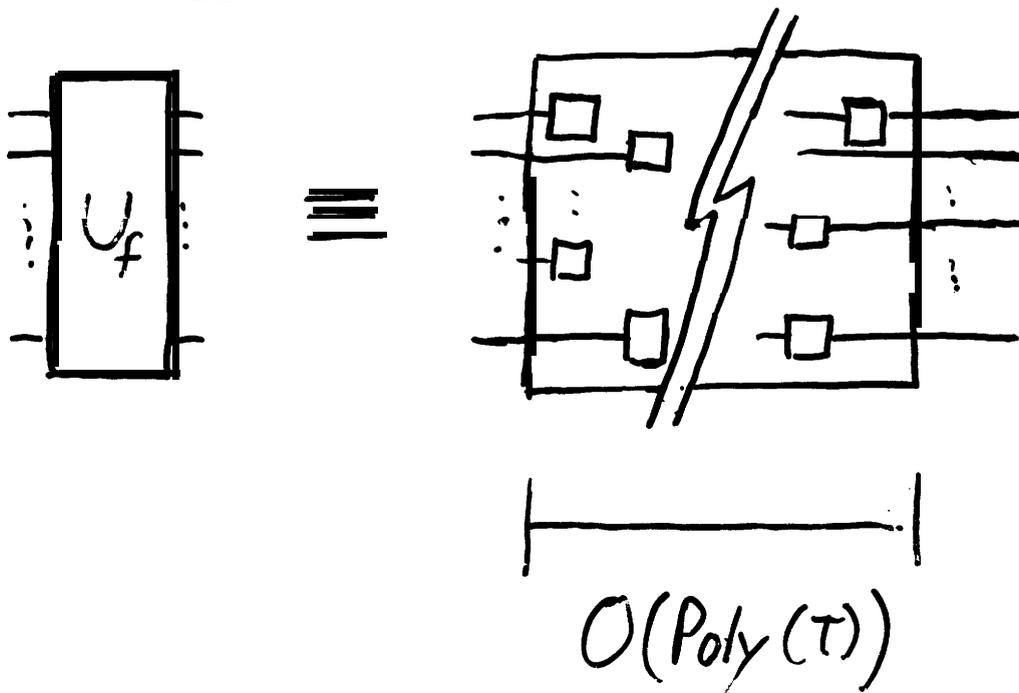

Lecerf-Bennett Theorem:

Thm: For all f computable in time $O(T)$, there exist a unitary matrix U such that

$$U_f |x, 0\rangle = |x, f(x)\rangle$$

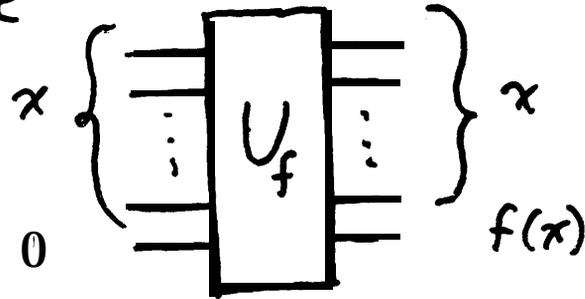

(actually: $U_f |x, b\rangle = |x, b \oplus f(x)\rangle$).

also

Idea of the solution to MDJP:

We have

But

$$U \left[\frac{1}{\sqrt{2}} (|x, 0\rangle + |y, 0\rangle) \right]$$

$$= \frac{1}{\sqrt{2}} (|x, f(x)\rangle + |y, f(y)\rangle)$$

So

$$U \left(\frac{1}{\sqrt{2^n}} \sum_{i=0}^{2^n-1} |i, 0\rangle \right) = \frac{1}{\sqrt{2^n}} \sum_{i=0}^{2^n-1} |i, f(i)\rangle$$

Superposing a Register:

Let $S = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix}$ then

$$|0\rangle \text{ --- } \boxed{S} \text{ --- } \frac{1}{\sqrt{2}} (|0\rangle + |1\rangle)$$

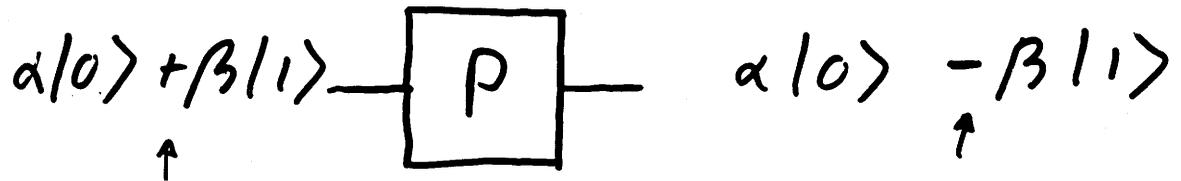

Now, consider

$$\begin{array}{c}
 \left. \begin{array}{c}
 \text{--- } \boxed{S} \text{ ---} \\
 \text{--- } \boxed{S} \text{ ---} \\
 \vdots \\
 \text{--- } \boxed{S} \text{ ---}
 \end{array} \right\} \text{ } n \text{ qubits} \\
 \boxed{S_n}
 \end{array}
 | \psi \rangle = \bigotimes_n \left(\frac{1}{\sqrt{2}} \sum_{i=0}^{2^n-1} |i\rangle \right)$$

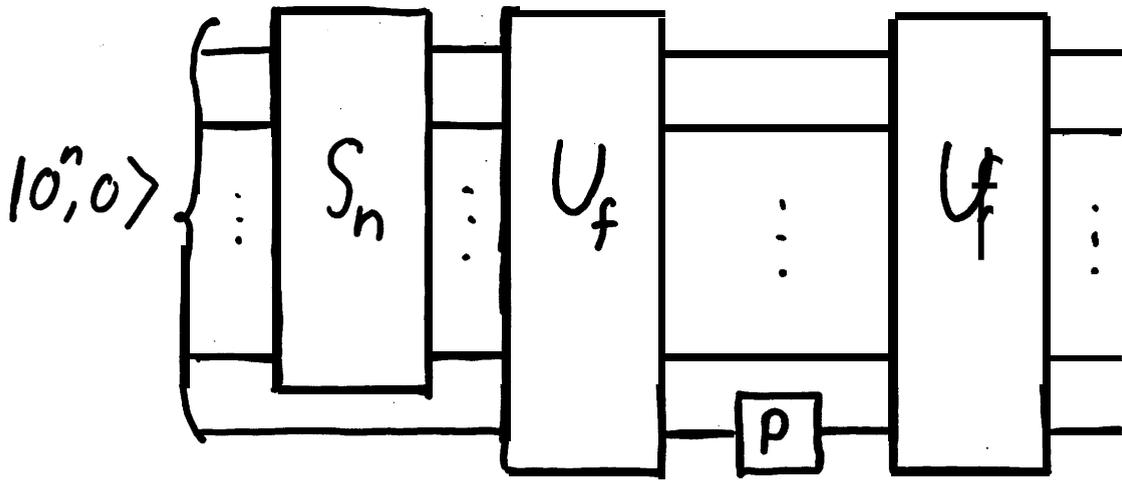

$$\text{and } S_n = \bigotimes_n S$$

Another Gate:

Let $P = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$ then

The Solution:

$$|0^n, 0\rangle \rightarrow \frac{1}{\sqrt{2^n}} \sum_{i=0}^{2^n-1} |i, 0\rangle$$

$$\rightarrow \frac{1}{\sqrt{2^n}} \sum_{i=0}^{2^n-1} |i, f(i)\rangle$$

$$\rightarrow \frac{1}{\sqrt{2^n}} \sum_{i=0}^{2^n-1} (-1)^{f(i)} |i, f(i)\rangle$$

$$\rightarrow \frac{1}{\sqrt{2^n}} \sum_{i=0}^{2^n-1} (-1)^{f(i)} |i, 0\rangle$$

Solution (cont.):

$$\text{Let } |\chi\rangle = \frac{1}{\sqrt{2^n}} \sum_{i=0}^{2^n-1} |i, 0\rangle$$

and consider the observable $\mathcal{O} = \{E_1, E_2\}$ where

$$E_1 = [|\chi\rangle] \text{ and } E_2 \perp E_1$$

Claim: The gate array + \mathcal{O} solve the MDJP.

Proof:

$$\text{Final State: } |\psi\rangle = \frac{1}{\sqrt{2^n}} \sum_{i=0}^{2^n-1} (-1)^{f(i)} |i, 0\rangle$$

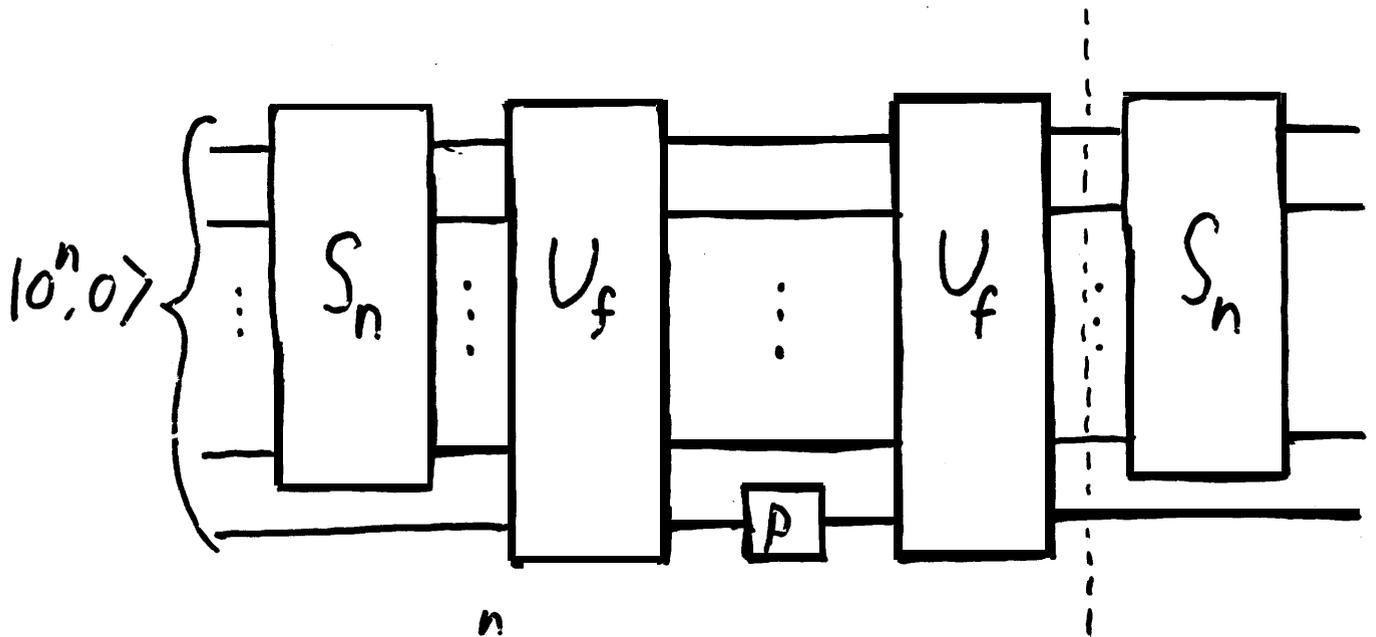

What is the proj. of $|\psi\rangle$ in E_1 ?

$$\begin{aligned} \langle \chi | \psi \rangle &= \left(\frac{1}{\sqrt{2^n}} \sum_{j=0}^{2^n-1} \langle j, 0 | \right) \left(\frac{1}{\sqrt{2^n}} \sum_{i=0}^{2^n-1} (-1)^{f(i)} |i, 0\rangle \right) \\ &= \frac{1}{2^n} \sum_{i=0}^{2^n-1} (-1)^{f(i)} \end{aligned}$$

3 cases:

- 1) f balanced: $\langle \chi | \psi \rangle = 0$
(always an " E_2 " answer)
- 2) f constant: $\langle \chi | \psi \rangle = \pm 1$
(always an " E_1 " answer)
- 3) f not 1 or 2: $\langle \chi | \psi \rangle \in]0, 1[$
(either answer)

Improvement on the D1 problem:

$$|\varphi\rangle = \frac{1}{\sqrt{2^n}} \sum_{i=0}^{2^n-1} (-1)^{f(i)} |i, 0\rangle$$

Recall that $S_n |w\rangle = \frac{1}{\sqrt{2^n}} \sum_{\gamma=0}^{2^n-1} (-1)^{w \cdot \gamma} |\gamma\rangle$

$$S_0 S_n |\varphi\rangle = \frac{1}{\sqrt{2^n}} \sum_{i=0}^{2^n-1} \sum_{\gamma=0}^{2^n-1} (-1)^{f(i)} (-1)^{i \cdot \gamma} |\gamma\rangle$$

We now observe with the Standard basis.

Improvement (cont.):

$$\text{Final State: } \frac{1}{2^n} \sum_{j=0}^{2^n-1} \sum_{i=0}^{2^n-1} (-1)^{f(i)} (-1)^{i \cdot j} |j, 0\rangle$$

Consider the amplitude of $|0^n, c\rangle$:

$$\forall i \quad i \cdot c^n = 0 \quad \rightarrow \quad \frac{1}{2^n} \sum_{j=0}^{2^n-1} (-1)^{f(i)} = a_c$$

3 cases

- 1) f balanced: $a_c = 0 \rightarrow$ observing Never $|0^n, c\rangle$
- 2) f constant: $a_c = \pm 1 \rightarrow$ always $|0^n, c\rangle$
- 3) f other: $a_c \neq 0, \pm 1 \rightarrow$ maybe $|0^n, c\rangle$

Same argument as before
