

How humans don't think

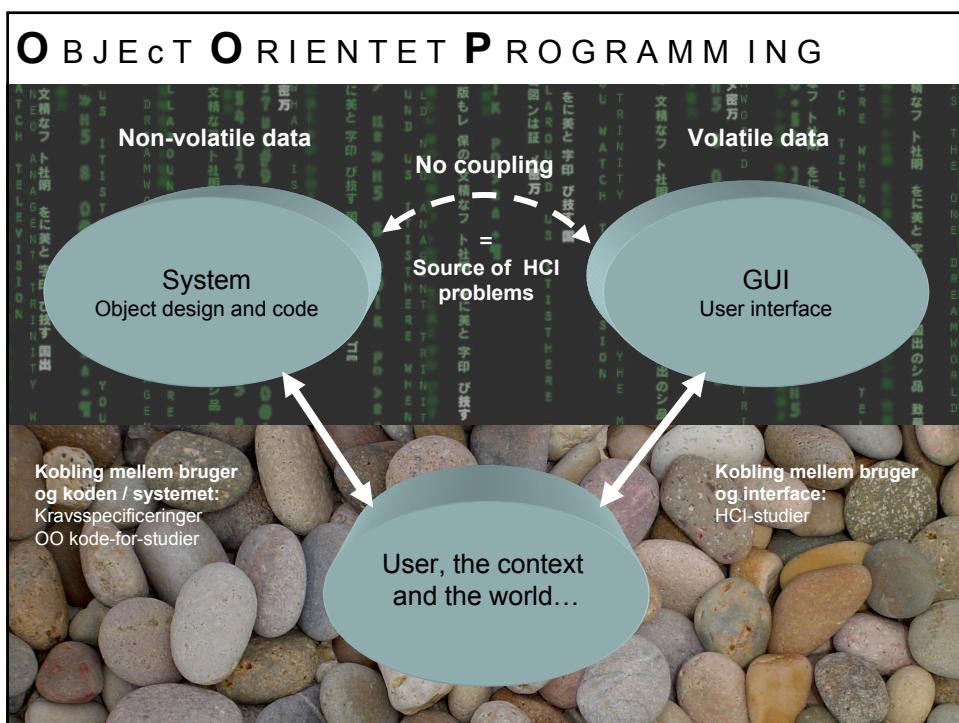

- But computers think we think
and makes us think

Three themes

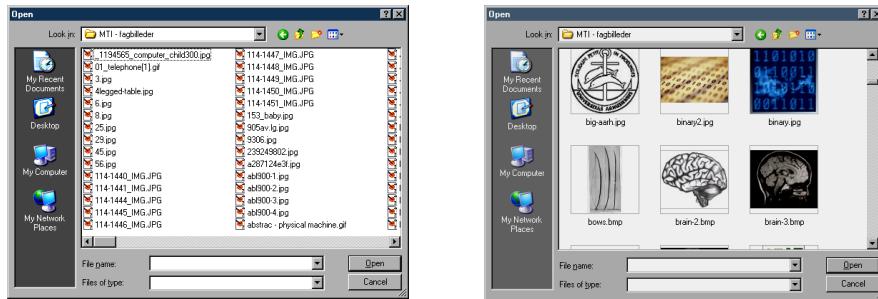

- Volatile data – a problematic concept
 - State-event nature of computing
 - Featural vs. spatiotemporal information
- All three themes are interlinked

The case against software:

- Software is not geared to work with spatiotemporal information
- Object oriented software is at a deep level not geared to be sensitive to what goes on in the GUI
- Software thus needs to be reconceptualized or else we will have to keep on patching

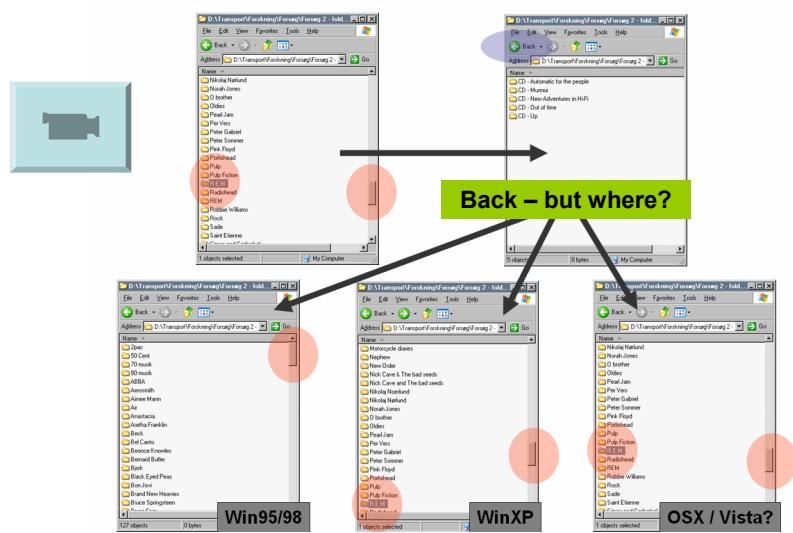

Volatile data 1

Thumbnails please – also the next time!

Volatile data 2

Volatile data 3

The user against the system

What defines an object?

- Path integration (vector summation)
- Landmark / cue or place learning
- Geometric
- Visuelle templates

food

nest

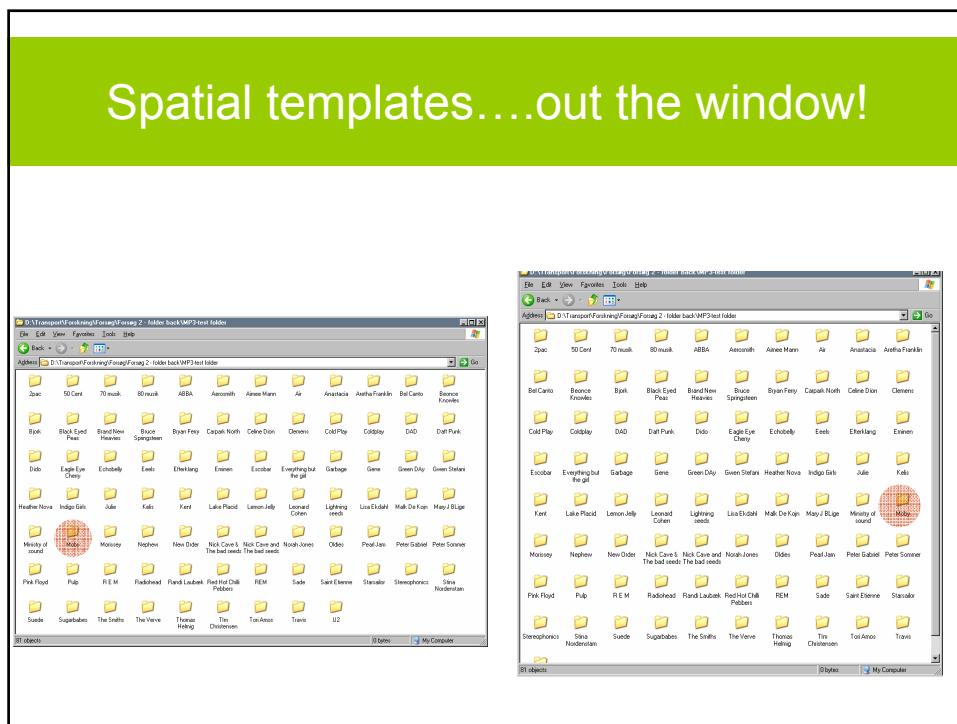

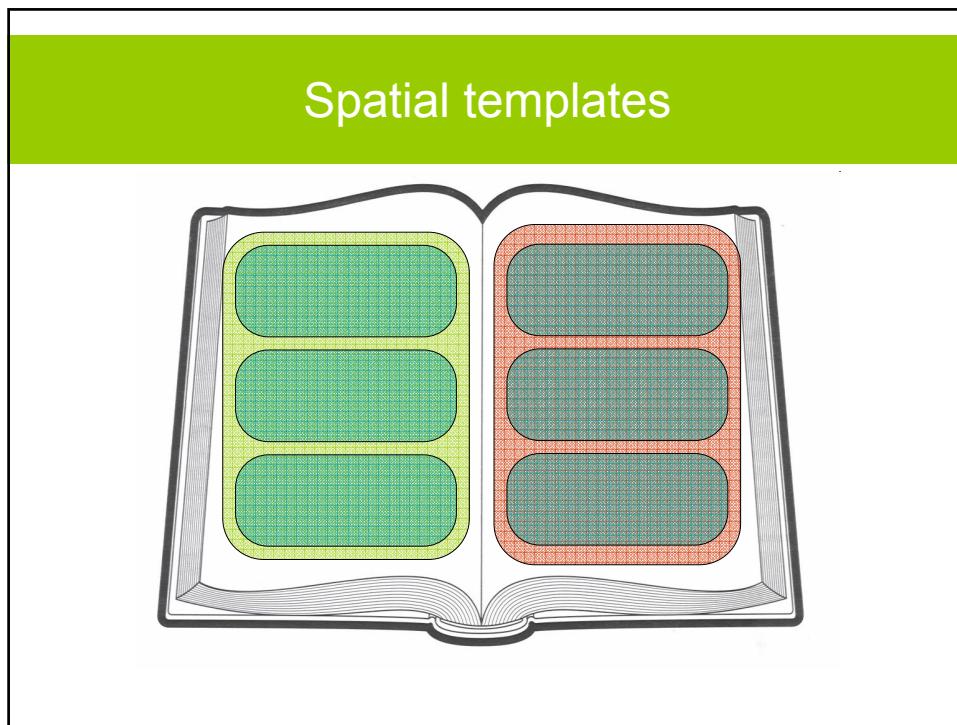

25 m

Ingen geometrisk specifikation

4 hjørner men ingen geometrisk specifikation af hjørne

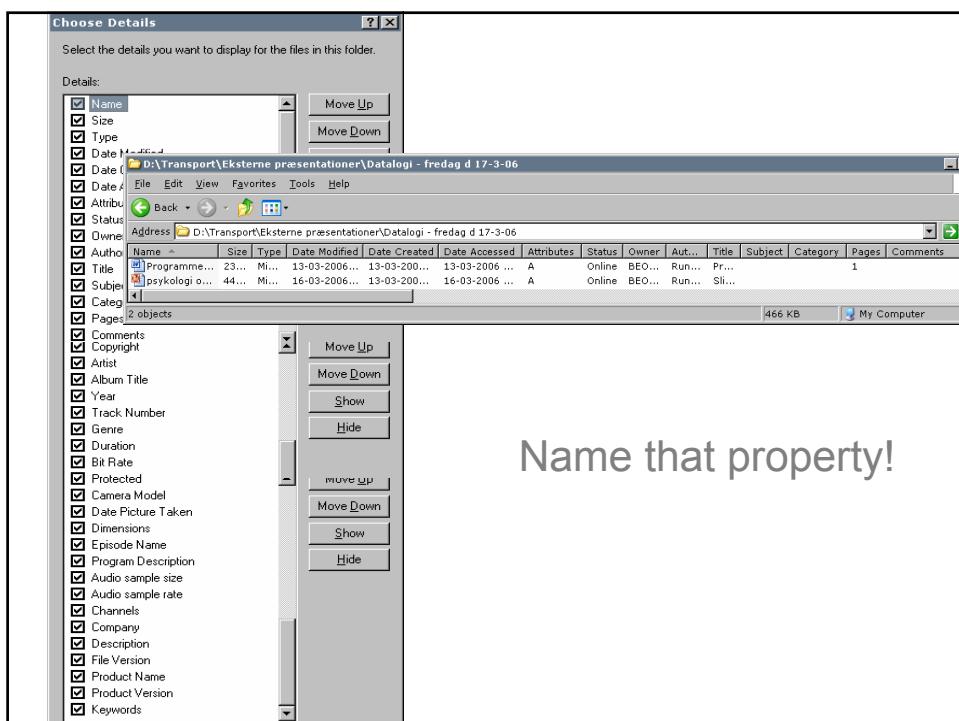

Geometrisk specifikation af 2 ud af 4 hjørner

3 hjørner med geometrisk specifikation af alle hjørner

What defines an object?

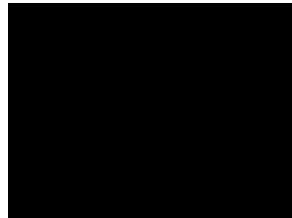

- Featural information: colour, texture, shape
- Spatiotemporal information: number, place, relation to me
- Navigational strategies taps into spat.temp. information and relations

Silly research – change blindness

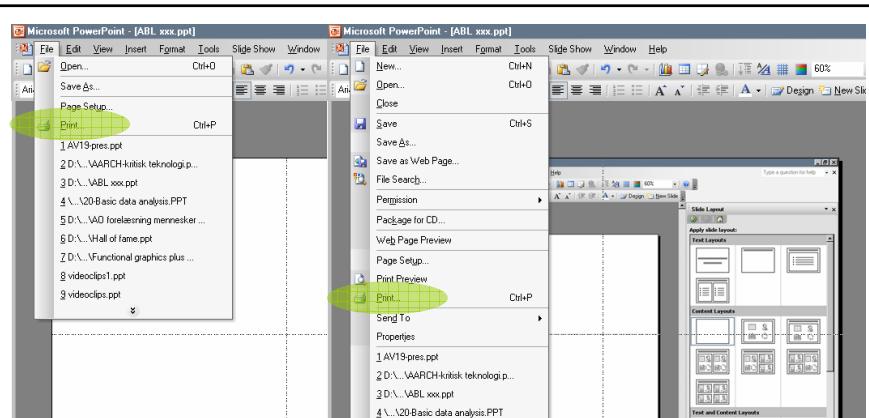

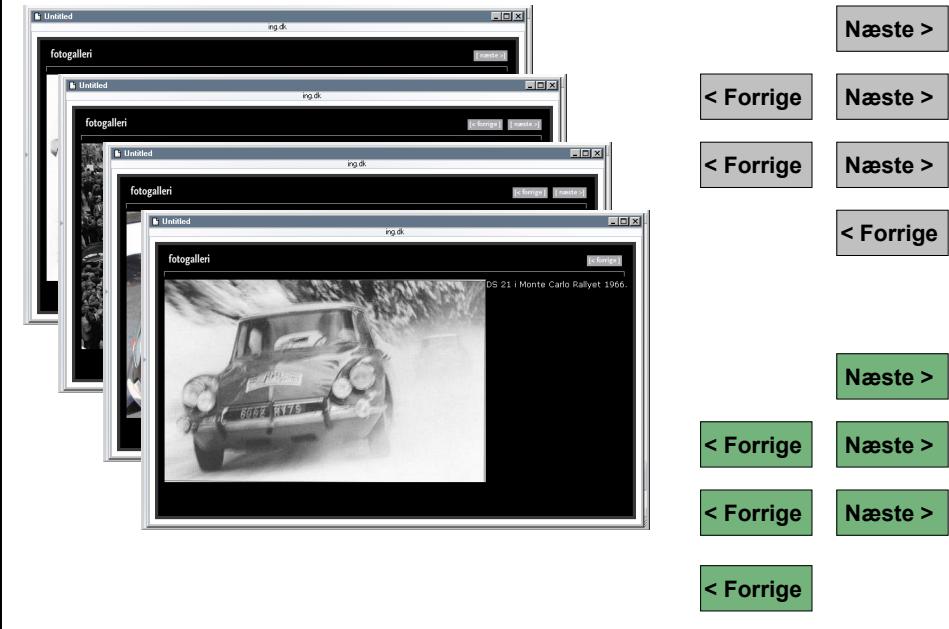

Silly research – change blindness

Humans do not register all details in the world for future comparison to check if something magically has disappeared – why should we, the world does not work that way!

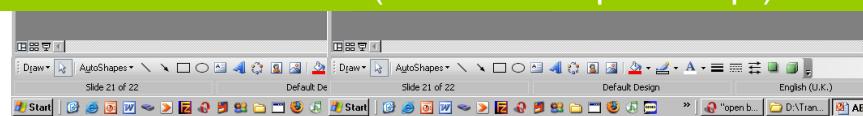

A good example of how to get puzzled by something by not realising that humans live in a real world!

CHANGE BLINDNESS

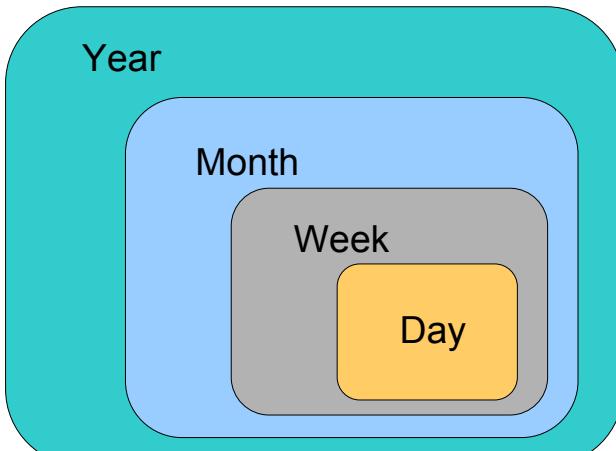

Dynamic menus

- Place vs. name (featural vs. spat. temp.)

Functional logic?

Quality of service

- Different processes in software needs to be time-synced in order to allow for a quality of service in relation to a human cognitive understanding.
- Speech and picture, which are out of sync are equally annoying.

State - event

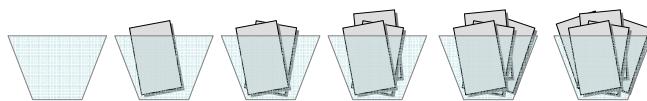

Graphics are merely used as eye-candy, and not as a true reflection of the system: patchwork graphics will never work! Even good patchworks will sooner or later fall through given the right conditions, which the programmer never anticipated. As we say in the hood: "Keep it real!"

Icons vs. indexes

The iconic bin

The indexical bin

0, 1, 2, 3 ,4, many
